

Homework 1: Transformations, Quaternions and Homogeneous Representation

A Translation and Rotation

- (0) Consider a point \mathbf{p} with coordinates $\mathbf{p} = [4, 0.9, -0.1]^T$, provide the coordinates of the transformed points \mathbf{p}' , \mathbf{p}'' , \mathbf{p}''' , \mathbf{p}'''' after applying the following transformation:
 - translation \mathcal{T}_t with translation vector $\mathbf{t} = [1, -1.4, 7.0]^T$
 - rotation $\mathcal{R}_z(\phi)$ with $\phi = 50^\circ$
 - rotation $\mathcal{R}_z(\phi_1)$ followed by $\mathcal{R}_y(\phi_2)$ with $\phi_1 = -30^\circ$ and $\phi_2 = 90^\circ$
 - translation \mathcal{T}_t as in (a) followed by a rotation $\mathcal{R}_z(\phi)$ as in (b)
- (0) Convert the following rotation

$$\mathcal{R} = \begin{bmatrix} 0 & -1 & 0 \\ \frac{\sqrt{2}}{2} & 0 & -\frac{\sqrt{2}}{2} \\ \frac{\sqrt{2}}{2} & 0 & \frac{\sqrt{2}}{2} \end{bmatrix}$$

using the following representation:

- Euler-Angles with the first rotation around the z -axis, second around y and third around x
 - Axis-Angle in the minimal form
- (0) Check if the following matrices are true rotation matrices

$$\mathcal{M}_1 = \begin{bmatrix} \frac{\sqrt{3}}{2} & -\frac{1}{2} & 0 \\ \frac{1}{4} & \frac{\sqrt{3}}{4} & -\frac{\sqrt{3}}{2} \\ \frac{\sqrt{3}}{4} & \frac{3}{4} & \frac{1}{2} \end{bmatrix} \quad \mathcal{M}_2 = \begin{bmatrix} 0 & -\frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{2} \\ \frac{\sqrt{2}}{2} & \frac{1}{2} & \frac{1}{2} \\ -\frac{\sqrt{2}}{2} & \frac{1}{2} & \frac{1}{2} \end{bmatrix} \quad \mathcal{M}_3 = \begin{bmatrix} \frac{\sqrt{3}}{2} & \frac{1}{4} & \frac{1}{2} \\ \frac{\sqrt{2}}{2} & -\frac{\sqrt{2}}{2} & \frac{1}{4} \\ \frac{-\sqrt{3}}{2} & \frac{1}{2} & \frac{\sqrt{3}}{2} \end{bmatrix}$$

B Quaternions

- (0) Given the quaternions $\mathbf{q}_1 = [0, 1, 2, 1]^T$ and $\mathbf{q}_2 = [3, 2, 1, 2]^T$
 - compute the quaternion resulting by the sum of \mathbf{q}_1 and \mathbf{q}_2
 - compute the inverse of \mathbf{q}_2
 - compute \mathbf{q}_1 times the inverse of \mathbf{q}_2
- (0) Given a rotation $\mathcal{R}_x(\phi)$ with $\phi = -40^\circ$ in euclidean form
 - compute the quaternion \mathbf{q}_1 that represent such rotation
 - given a point χ with euclidean coordinates $\mathbf{x} = [8, 1.5, 1]^T$, apply the rotation \mathbf{q}_1 to the point χ in quaternion form
 - apply to point χ the transformation resulting from \mathbf{q}_1 followed by $\mathbf{q}_2 = [-1, 2, 0, 1]^T$

C Homogeneous Representation

- (0) Given the points χ_1 and χ_2 with their coordinates

$$\mathbf{x}_1 = \begin{bmatrix} 4 \\ -4 \end{bmatrix} \quad \mathbf{x}_2 = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

and the line ℓ_1

$$\ell_1 : y = 2 - x.$$

determine the homogeneous representation of:

- (a) ℓ_1 , χ_1 and χ_2
 - (b) line ℓ_2 passing through χ_1 and χ_2
 - (c) the intersection point of ℓ_1 and ℓ_2 , if any
 - (d) determine if χ_3 with coordinates $\mathbf{x}_3 = [4, 2]^T$ lies on ℓ_2
7. **(0)** Given a point χ with coordinates $\mathbf{x} = [18, 20, -5]^T$, compute and apply the following transformations in homogeneous representation:
- (a) translation \mathcal{T}_t with translation vector $\mathbf{t} = [-1, -2, 2]^T$
 - (b) rotation $\mathcal{R}_z(\phi)$ with $\phi = 56^\circ$
 - (c) the rigid body transformation resulting from (a) and (b)
 - (d) the transformation given by \mathcal{H}_1 followed \mathcal{H}_2 with:

$$\mathcal{H}_1 = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{2} & -1 \\ 0 & -\frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{2} & 2 \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad \mathcal{H}_2 = \begin{bmatrix} \frac{\sqrt{3}}{2} & -\frac{1}{2} & 0 & 0 \\ \frac{1}{2} & \frac{\sqrt{3}}{2} & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$
